The Status of the Higgs Search

J. Incandela for the CMS COLLABORATION

July 4th, 2012

1 Missing piece: Higgs
Where we stood last week

1. **$M_{\text{top}}$ vs. $M_W$**
   - Tevatron $M_W$ *Tour de Force!!*
     - $m_W = 80385 \pm 15$ MeV (World Ave – Mar 2012)
   - Shifts for SM Higgs expectation

2. **Colliders leave little space**

   \[ \sim M_t^2 \]

   \[ \sim \ln(m_H) \]

   This is the main story of the past year

   Eliminated $\sim 475$ GeV of the mass range.
$\sqrt{s}=8$ TeV: 25-30% higher $\sigma$ than $\sqrt{s}=7$ TeV at low $m_H$

- All production modes to be exploited
  - $gg$ VBF, VH, ttH
  - Latter 3 have smaller cross sections but better S/B in many cases
Higgs boson production

$\sqrt{s} = 8$ TeV:
- 25-30% higher $\sigma$ than $\sqrt{s} = 7$ TeV at low $m_H$
- All production modes to be exploited
  - $gg$ VBF, VH, ttH
  - Latter 3 have smaller cross sections but better S/B in many cases
5 decay modes exploited

- High mass: \(WW, ZZ\)
- Low mass: \(bb, \tau\tau, WW, ZZ, \gamma\gamma\)
- Low mass region is very rich but also very challenging: main decay modes (\(bb, \tau\tau\)) are hard to identify in the huge background
- Very good mass resolution (1\%): \(H\rightarrow\gamma\gamma\) and \(H\rightarrow ZZ\rightarrow 4l\)
- Not-yet-excluded region: ~[115-130] GeV
- The five decay modes discussed today have comparable sensitivities for exclusion.
- Most analyses used in this combination have been re-optimized. In order to avoid the possibility of an unintended bias, all selection criteria in the analyses of the 2011 and 2012 data were fixed before looking at the result in the signal region.
p-values

- Probability that background fluctuates to give an excess as large as the (average) signal size expected for a SM Higgs.
  - Takes into account all analysis steps, estimated backgrounds, etc. for the 5 search channels indicated.
- Excellent prospects for exploring properties
How is it possible to go so far so fast?

LHC performance: 2010-2011-2012

Stellar performance of the LHC enables all experiments to produce significant physics results.

Many thanks to the LHC teams and the many others who made this possible!
Total weight 14000 t
Overall diameter 15 m
Overall length 28.7 m

- **Solenoid coil**

- Muon RPC: 98.2%
Single electron energy scale ($E/p$) stability in barrel measured with $W \rightarrow e\nu$ events

- **W$\rightarrow$ev $E/p$:** Stable $E$ scale during 2012 run after light monitoring (LM) corrections:
  - **ECAL Barrel (EB):** RMS stability after corrections 0.19%

- **Z$\rightarrow$ee:** Good resolution with preliminary energy calibration for 2012:
  - Instrumental resolution: 1.0 GeV in ECAL Barrel

- **Z$\rightarrow$ee invariant mass distribution for electrons measured in the barrel**

**ECAL calibration, 2012 data**
Last Autumn
- CPU time for high PU >40 sec/event
- Memory usage well above 2 GB.
  - Means we cannot use all the cores!
- Even 200 Hz looked hard!

Task force started December
- Major success!

Improvements
- A factor 2.5 in speed
  - Under ~15" per event on average
- Much reduced memory use
  - Well under 2 GB

Physics performance unchanged
- Kept our AAA rating:
  - E.g. no explicit $p_T$ threshold on tracks

Prompt Reconstruction at Tier-0:
Limit on our data-taking rate versus event processing time for low and high memory use cases
- **Sustain 400M/Month**
  - 900M, 600M past 2 months but had help from Tier-1’s

- **Sustain 1B/month**
  - Peaks high as 2.3B
Reconstruction
Global Event Description (Pflow)

Made possible by CMS granularity and high magnetic field

- Optimal combination of information from all subdetectors
- Returns a list of reconstructed particles
  - $e, \mu, \gamma$, charged and neutral hadrons
    - Used in the analysis as if it came from a list of generated particles
    - Used as building blocks for jets, taus, missing transverse energy, isolation and PU particle identification
Cluster reconstruction in ECAL
- Common for both electrons and photons (Electrons also reconstructed as photons)
- Designed to collect bremsstrahlung and conversions in extended phi region

Dedicated track reconstruction for electrons
- Gaussian Sum Filter allows for tracks w/large bremsstrahlung

Photon identification specific to H→ϒϒ

Energy scale and resolution
- Extensive control with Z and J/ψ→ee for both electrons and photons
Electron identification

- Multivariate e identification in 2012
  - ECAL, tracker, ECAL-tracker-HCAL matching, impact parameter
  - 30% efficiency improvement in $H \rightarrow ZZ \rightarrow 4e$ wrt cut based ID
- Multivariate training against background in data

![Graph showing electron identification](image-url)
- Start with particle flow muons
- Efficiency above 96% down to $p_T = 5$ GeV
- Above 99% efficiency for $p_T > 10$ GeV
- Efficiency in data using $J/\Psi \rightarrow \mu \mu$ and $Z \rightarrow \mu \mu$ Tag&Probe
- Efficiency is stable in high PU environment
- Tighter quality criteria applied in some analyses
Sum energy of particles in $\Delta R$ cone around the lepton

- Global event description eliminates double counting

Efficiency is stable in high PU environment

Detector vs Particle Flow Isolation

- Detector Isolation
- Particle Flow Isolation

Pile-up contribution:
- Negligible for charged hadrons (vertexing)
- Neutrals corrected with global energy density

Endcaps $p_T < 10$ GeV
• Tau identification:
  - Reconstruct individual decay modes
  - Charged hadrons + electromagnetic obj
    - EM strips account for material effects

• Tau isolation:
  - Multivariate discriminator using sum of energy deposits in dR rings around the tau

**Real taus**  
**Fake taus**
Jet Identification

- Jet reconstruction
  - Reconstruction with particle flow objects

- Typical jet
- Pileup jet

- Pileup jets structure differs wrt regular jets:
  - Pileup jets originate from several overlapping jets which merge together
  - Likelihood grows rapidly with high pileup

- Discriminant exploits shape and tracking variables
  - discrimination both inside and outside tracker acceptance
Standard Model: Precision Jets, W, and $\gamma^*/Z$

Inclusive jet and dijets. 2-4% JES. Constrains gluon PDF up to $x=0.6$

Differential Drell-Yan cross section: 2.5M $\mu\mu$ pairs tests NNLO cross sections and PDFs

CMS-PAS-QCD-11-004

CMS-PAS-EWK-11-007
Fabulous agreement
Lots of data
... on to the Higgs...
The Status of the Higgs Search

J. Incandela for the CMS COLLABORATION

H → γγ candidate
Main analysis is a Multi-Variate-Analysis (MVA)
- MVAs for photon ID and event classification
  - Fit mass distribution in 4 event classes based on a diphoton MVA output + 2 di-jet categories
- Improvement in expected limit ~15% over cut-based analysis
- Cross-checked with an alternative background model extraction:
  - Fit output of a 2nd MVA combining diphoton MVA and $m_{\gamma\gamma}$ using data in mass sidebands to construct the background model
- Also cross-checked with a cut based analysis
  - Simple and robust
    - Cut based photon ID and event classification
      - Fit data mass distribution in 2 rapidity x 2 shower shape =4 categories with different Signal over Background (S/B) + 2 di-jet categories
- Published for 2011 data
Search for a narrow mass peak with two isolated high Et photons

2012 8 TeV

- Blind analysis in 2012
- Re-reco 2011 data into unchanged 2011 analysis
- Background MC only used for analysis optimization, Z->ee also to measure photon efficiencies and resolution with data
- ECAL cluster energies corrected using a MC trained multivariate regression
  - Improves resolution and restores flat response of energy scale versus pileup
    - Inputs: Raw cluster energies and positions, lateral and longitudinal shower shape variables, local shower positions w.r.t. crystal geometry, pileup estimators
- Regression also used to provide a per photon energy resolution estimate
- To measure the Energy Scale and resolution: use $Z \rightarrow e^+e^-$
- Photon pre-selection:
  - $E_{T\gamma_1}/m_{\gamma\gamma} > 3$, $E_{T\gamma_2}/m_{\gamma\gamma} > 4$
  - Photon Id a bit tighter than trigger selection and MC EM enrichment filters
    - Efficiency measured using tag and probe with $Z\rightarrow ee$
  - Electron veto: Efficiency measured using tag and probe with $Z\rightarrow \mu\mu\gamma$
- MVA based photon ID discriminates photons from fakes:
  - Inputs: isolation, shower shape, per event energy density, pseudorapidity
**The $\gamma\gamma$ Vertex Choice**

- **Mass reconstruction**
  - Depends on the correct position of the primary vertex
- **Interaction vertex** is identified using tracks from recoiling jets and underlying event plus conversions
  - Correct in ~83% of cases for pileup in 2011 sample.
  - Correct in ~80% of cases for pileup in 2012 sample.
- **Vertex identification with a BDT**
  - Input variables: $\Sigma p_t^2$, $\Sigma p_t$ projected onto the $\gamma\gamma$ transverse direction, $p_t$ asymmetry and conversions
- **Correct vertex finding probability** also estimated using a BDT

---

**Figure:**

- **Graph 1:** Fraction of events with $p_T(\gamma\gamma) < 10$ GeV
  - True vertex efficiency vs. $p_T(\gamma\gamma)$
  - Average vertex probability

- **Graph 2:** Efficiency to identify correct vertex
  - Data-MC efficiency for $Z \rightarrow \mu\mu$
  - After removing the $\mu$ tracks

---

**Legend:**
- **Data:** $Z \rightarrow \mu\mu$
- **MC:** $Z \rightarrow \mu\mu$
Diphoton MVA trained on signal and background MC with input variables largely independent of $m_{\gamma\gamma}$
- Kinematics: $p_T$ and $\eta$ of each photon, and $\cos\Delta\phi$ between the 2 photons
- Photon ID MVA output for each photon
- per-event mass resolution and vertex probability
- Encode all relevant information on signal vs background discrimination (aside from $m_{\gamma\gamma}$ itself) into a single di-photon MVA output to first order independent of $m_{\gamma\gamma}$

Residual data-MC disagreement
- For BG only make analysis sub-optimal
- For signal would cause some category migration included in the systematic errors
Di-jet Tagging

- Exclusive selection of di-photon events with VBF-like topology:
  - Two high $p_T$ jets with large pseudo-rapidity difference and invariant mass
- High S/B
- ~80% pure VBF events for large di-jet invariant masses

Di-jet event with:
- diphoton mass 121.9 GeV
- dijet mass 1460 GeV
- jet $p_T$: 288.8 and 189.1 GeV
- jet $\eta$: -2.022 and 1.860
Analysis improvements in 2012:

- Split di-jet tagged events in two categories based on $M_{jj}$ and jet $p_T$
  - $\sim$15% improvement in sensitivity for dijet category
  - Better sensitivity to separate different Higgs production modes
- Removal of jets from pileup events
  - Based on the jet shape variables, tracks in jet and vertexing
  - Cross-checked using $Z+$jet and $\gamma+$jet events

Background model is entirely from data.

Fit to mass distribution in each category with polynomial functions (3\textsuperscript{rd} to 5\textsuperscript{th} degree)

- keep bias below 20% of fit error.
- causes some loss of performance due to number of parameters in fit function.
8 TeV Mass Distribution in Categories

Untagged 0

Untagged 1

Untagged 2

Untagged 3

Dijet tight

Dijet loose
- Sum of mass distributions for each event class, weighted by S/B
  - B is integral of background model over a constant signal fraction interval
- Expected 95% CL exclusion 0.76 times SM at 125 GeV
- Large range with expected exclusion below $\sigma_{SM}$
- Largest excess at 125 GeV
- Minimum local p-value at 125 GeV with a local significance of 4.1 σ
- Similar excess in 2011 and 2012
- Independent cross check analyses give similar results
- Global significance in the full search range (110-150 GeV) 3.2 σ
Combined best fit signal strength
\[ \frac{\sigma}{\sigma_{SM}} = 1.56 \pm 0.43 \times SM, \]
consistent with SM.

Best fit signal strength consistent between different classes

Combined best fit signal strength
\[ \frac{\sigma}{\sigma_{SM}} = 1.56 \pm 0.43 \times SM, \]
consistent with SM.
$H \rightarrow \text{ZZ}^*$
H → ZZ(*) → 4l $\ (l = e, \mu)$; the golden channel

Clean signature: narrow peak, low background

Background: irreducible ZZ(*); reducible Z+jets, ttbar, WZ

One of the best performing channels in the whole mass range ...

... but extremely demanding channel for selection, requiring the highest possible efficiencies (lepton Reco/ID/Isolation).
Blinding policy: analysis optimized blindly for 2012, applied to 2011 reoptimization

Do NOT look at $110 < m_{4l} < 140$ GeV, and $m_{4l} > 300$ GeV

Main changes:

- New lepton ID (MVA + PFlow)
- New lepton PFlow isolation
- Final State Radiation (FSR) recovery
- 2D analysis: $m_{4l} +$ Kinematic Discriminant

>20% improvement @ $m_H = 126$ GeV wrt 2011 analysis

Expected exclusion range 121–540 GeV
Final State Radiation recovery algorithm

- Applied on each Z for photons near the leptons

ΔR(ℓ, γ)_{min} < 0.5

Particle Flow ID
E_T > 2 GeV
|η| < 2.4
Isolation

- Associates photon with Z if:
  - M(ll+γ) < 100 GeV
  - |M(ll+γ)-M_Z| < |M(ll)-M_Z|
- Removes associated photons from lepton isolation calculation

Expected Performance for M_H = 126 GeV

- 6% of events affected
- Average purity of 80%
- 2% added in analysis
Background models

- Irreducible background $ZZ \rightarrow 4l$
  - Estimated using simulation
  - Phenomenological shape models
  - Corrected for data/simulation scale

- Reducible backgrounds estimated from data
  - Extrapolation from control samples enriched with misidentified leptons
  - Total uncertainty $\sim 50\%$

Validation in data

- Signal Region (WFC)
  - irreducible (sim.): 2.6
  - reducible (data): 11.3
  - observed: 12

wrong flavors & charges

control sample
**Matrix Element Likelihood Analysis:**

uses kinematic inputs for signal to background discrimination

\[ \{m_1, m_2, \theta_1, \theta_2, \theta^*, \Phi, \Phi_1\} \]

\[
MELA = \left[ 1 + \frac{P_{bkg}(m_1, m_2, \theta_1, \theta_2, \Phi, \theta^*, \Phi_1 | m_{4\ell})}{P_{sig}(m_1, m_2, \theta_1, \theta_2, \Phi, \theta^*, \Phi_1 | m_{4\ell})} \right]^{-1}
\]

**SM H(125 GeV) qqZZ**

[Diagram showing kinematic inputs and the MELA formula](http://arxiv.org/abs/arXiv:1001.5300)
2D analysis using \( \{m_{4l}, \text{MELA}\} \)

MELA offers powerful discrimination of background technique applicable for signal hypothesis testing.

- expected significance for SM Higgs: $4.7\sigma$
$H \rightarrow WW \rightarrow l\nu l\nu$
H→WW→lνlν Signature

μ P_T
32 GeV

e P_T
34 GeV

ME_T
47 GeV

μ P_T
32 GeV

e P_T
34 GeV

Main backgrounds:
- WW, top
- Other backgrounds:
  - W+jet, Z/γ*, WZ, ZZ, Wγ

Signature:
- 2 high p_T leptons
- large missing E_T

qq→WW + gg→WW
- Non-resonant

H→WW
- Large BR
- Small Δφ(ll)

July 4th 2012
The Status of the Higgs Search
J. Incandela for the CMS COLLABORATION
Data-driven background estimation

- **W+jets**
  Fake rate measured in QCD enriched data sample
- **Z/\gamma^***
  Normalised in Z mass
- **Top**
  b-tagging efficiency measured in top control region in data

Split in categories

- 0/1-jet and VBF
- Final state lepton flavors

Cut-based approach for the first 2012 result
One step before the final selection (no cuts on Δφ(ll) and m(ll))

Final selection on m(ll) (all other selection applied)
Combined limits from 2011 and 2012

- 7 TeV result using a multivariate discriminant and updated with the final luminosity measurement
- 2012 → 5% improvement in sensitivity coming from new object definitions and selection optimized for 2012 condition
Combination of 7 TeV + 8 TeV

- Combined limits from 2011 and 2012
  - 7 TeV result using a multivariate discriminant and updated with the final luminosity measurement
  - 2012 → 5% improvement in sensitivity coming from new object definitions and selection optimized for 2012 condition
Signal injection using prediction at 5.1/fb 8 TeV

- Average background prediction
- Signal injection for $m_H = 125$ GeV with toys
Signal injection using prediction at 5.1/ fb 8 TeV
- Average background prediction
- Signal injection for $m_H = 125$ GeV with toys
$VH \rightarrow Vbb$

$V \rightarrow l\nu, l\bar{l}, \nu\nu$
- Characteristics and importance
  - By far, largest BR for $m_H < 130$ GeV
  - Key piece of the observation puzzle
    - Tests specific production & decay couplings
- $\sigma_{bb}(\text{QCD}) \sim 10^7 \sigma \times \text{BR}(H \rightarrow bb)!$

$\Rightarrow$ Search in associated production with $W$ or $Z$
Analysis Strategy

Associated Production => final states with leptons, MET and b-jets

Reducible Backgrounds: QCD, top, W/Z+ light jets

Less reducible: V+bb, ZZ(bb), WZ(bb)

Boosted vector bosons: \( p_T(V) \)
2 b-tagged jets (H->bb)
Back-to-back V and H, reconstruct \( m_{bb} \)

Main backgrounds estimated from data in control regions

5 channels
- \( Z(\ell\ell)H(bb) \)
- \( Z(\nu\nu)H(bb) \)
- \( W(l\nu)H(bb) \)
- Here 5 fb-1 @ 7 TeV (2011) + 5 fb-1 @ 8 TeV (2012)
  - Improvements of ~ 50% in sensitivity:
  - Two Pt(V) bins: "low" and "high" – see backup
  - Fit the shape of the MVA output distribution (vs cut and count)
  - Improved b-jet energy resolution [MVA regression]

\[
\begin{align*}
  M_{bb} &= 128 \text{ GeV} \\
  p_T(bb) &= 181 \text{ GeV}
\end{align*}
\]
The Status of the Higgs Search

- **Observed limits:**
  - Compatible with either background or signal from a 125 GeV Higgs
Characterization of excess near 125 GeV

adding high sensitivity, but low mass resolution WW

comb. significance: $5.1\sigma$

expected significance for SM Higgs: $5.2\sigma$
$H \rightarrow \tau\tau$

$\rightarrow \mu\tau_h, e\tau_h, e\mu, \mu\mu$
### Characteristics
- High $\sigma \cdot BR$ at low mass
- Sensitive to all production modes
- Probes coupling to leptons
- Enhanced $\sigma \times BR$ in MSSM
- Challenging large backgrounds:
  - $DY \to \tau\tau$, $W+$Jets, QCD

### Excluded 99% CL
CMS 2011

**Gluon Fusion Process**

**VBF Process**

**VH Process**
- Search performed in 4 tau-pair final states: $\mu\tau_h$, $e\tau_h$, $e\mu$, $\mu\mu$
- Analysis divided into 5 categories: mass resolution, S/B
- All categories are fit simultaneously

Jets $p_T > 30$ GeV

- $0$ Jet, Low $p_T$
  - High background
  - $\tau_h$ or $\mu$ $p_T$

- $1$ Jet, Low $p_T$
  - Enhancement from jet requirement

- $1$ Jet, High $p_T$
  - Lepton $p_T$
  - Harder spectrum from $H$

- $1$ Jet, High $p_T$
  - Enhancement from $p_T$ and jet requirement

- VBF
  - $2$ jets, no jets in rapidity gap
  - MVA based selection

$^1$categorization based on $\tau_h$ $p_T$ for $\mu\tau_h$, $e\tau_h$; $\mu$ $p_T$ for $e\mu$; leading $\mu$ $p_T$ for $\mu\mu$
**Full $m(\tau\tau)$ Reconstruction**

- **SVFit**
  - Event-by-event estimator of true $m(\tau\tau)$ likelihood
    - Matrix Element used for $\tau \rightarrow l\nu\nu$
    - Phase-Space is used for $\tau \rightarrow \pi$
    - Nuisance parameters are integrated out
  - Mass peaks at true value
    - 20% improved resolution
    - With respect to 2011
    - Better separation of H from Z

---

![Diagram](image)

- $h_\text{Z}$ (integration)
Mass Distributions in Event Categories

- Constraints energy scales and efficiencies
  - Large Drell-Yan background
  - Sensitivity boosted by low/high $p_T$ split

- Enhanced sensitivity to gluon fusion
  - Improved mass resolution
  - Increased sensitivity by splitting into low and high $p_T$ categories

- Enhanced sensitivity to VBF production
  - Highest sensitivity for $m_H < 130$ GeV

- $e\mu$
- $e\tau_h$
- $\mu\tau_h$
- 0 Jet
- 1 Jet
- VBF

$\text{CMS 2011+2012, } \sqrt{s} = 7-8$ TeV, $L = 10$ fb$^{-1}$
- ~2x improvement in sensitivity in 2011 data alone
  - => 70% improvement in sensitivity on the same data
  - 40% improvement with the additional luminosity
- No significant departure from SM background-only expectation
  - Observed limit of $1.06 \times$ SM at $m_H = 125$ GeV
- ~2x improvement in sensitivity in 2011 data alone
- => 70% improvement in sensitivity on the same data
- 40% improvement with the additional luminosity
- No significant departure from SM background-only expectation
- Observed limit of $1.06 \times$ SM at $m_H = 125$ GeV
The Status of the Higgs Search

- ~2x improvement in sensitivity in 2011 data alone
  - => 70% improvement in sensitivity on the same data
  - 40% improvement with the additional luminosity
- No significant departure from SM background-only expectation
  - Observed limit of 1.06 x SM at $m_H = 125$ GeV
Full result
Expected in absence of SM Higgs boson:

110 – 600 GeV at 95% CL
110 – 580 GeV at 99% CL
110 – 520 GeV at 99.9% CL
SM Higgs exclusion: confidence level

**Observed:**

110 – 122.5

110—112 .. 113 – 121.5

[...] 127 – 600 GeV at 95% CL

[...] 128 – 600 GeV at 99% CL
SM Higgs exclusion: signal strength

**Observed:**

110 – 122.5

... 127 – 600 GeV at 95% CL
Characterization of excess near 125 GeV

- high sensitivity, high mass resolution channels: $\gamma\gamma+4l$
  - $\gamma\gamma$: 4.1 $\sigma$ excess
  - 4 leptons: 3.2 $\sigma$ excess
  - near the same mass 125 GeV
- comb. significance $\boxed{5.0 \sigma}$
- expected significance for SM Higgs: 4.7 $\sigma$
Characterization of excess near 125 GeV

adding high sensitivity, but low mass resolution WW

comb. significance: $5.1 \sigma$

expected significance for SM Higgs: $5.2 \sigma$
Characterization of excess near 125 GeV

- all channels together:
  comb. significance: $4.9 \sigma$

- expected significance
  for SM Higgs: $5.9 \sigma$
Characterization of excess near 125 GeV

- Observed significance: 4.9 $\sigma$

- Excess seen in both
  - 7 TeV data (3.0 $\sigma$)
  - 8 TeV data (3.8 $\sigma$)
  - near the same mass 125 GeV
Characterization of the excess: mass

- Likelihood scan for mass and signal strength in three high mass resolution channels
- results are self-consistent and can be combined
Characterization of the excess: mass

To reduce model dependence, allow for free cross sections in three channels and fit for the common mass:

\[ m_X = 125.3 \pm 0.6 \text{ GeV} \]
- We have observed a state decaying to di-photon and four-lepton final state with statistical significance of 5 $\sigma$

- The observed state has mass near $125.3 \pm 0.6$ GeV

- Next we look at the extent to which the observed state is compatible, within the current uncertainties, with the SM Higgs boson
Compatibility with SM Higgs boson

Signal strength

- Overall best-fit signal strength in the combination:
  \[ \sigma / \sigma_{SM} = 0.80 \pm 0.22 \]
- Signal strength in 7 and 8 TeV data are self-consistent
Event yields in different production times decay modes are self-consistent

- albeit many modes have not yet reached sensitivity to distinguish SM from Background
Compatibility with SM Higgs boson event yields in different modes (2)

- Event yields in different decay modes are self-consistent
- Event yields in different production topologies are self-consistent

\( m_H = 125 \text{ GeV} \)

CMS Preliminary

\( \sqrt{s} = 7 \text{ TeV}, L = 5.1 \text{ fb}^{-1} \)

\( \sqrt{s} = 8 \text{ TeV}, L = 5.3 \text{ fb}^{-1} \)

- \( H \rightarrow \text{bb} \)
- \( H \rightarrow \tau \tau \)
- \( H \rightarrow \gamma \gamma \)
- \( H \rightarrow WW \)
- \( H \rightarrow ZZ \)
The measurement of the $H \rightarrow WW/H \rightarrow ZZ$ ratio is mostly driven by the ratio of the Higgs couplings to WW and ZZ, which is protected by custodial symmetry.

Combination of “inclusive” WW and ZZ yields gives

$$R_{WW/ZZ} = 0.9^{+1.1}_{-0.6}$$
Group the Higgs couplings into “Vectorial” and “Fermionic” sets.

Attach a modifier to the SM prediction to each of those ($C_V$ and $C_F$).

Use LO theoretical prediction for loop-induced $H \rightarrow \gamma\gamma$, $H \rightarrow gg$ couplings.

In agreement with the SM within the 95% confidence range

→ Need more data!

In summary

We have observed a new boson with a mass of

125.3 ± 0.6 GeV

at

4.9 σ significance!
A very wide range of measurements have shown that SM predictions for known physics have been ~spot on.

A tribute to a large amount of work done by our theory colleagues along with the results from the other collider experiments at LEP, Tevatron, HERA, b-factories etc.

And the Higgs cross section WG and all those theorists who prepared the way for today!

First (single) beams circulating in the machine
The LHC Project (the accelerator, the experiments, and computing) have required a long and painstaking effort on a global scale encompassing the terms of 6 Director Generals, 3 LHC Project Leaders, and 6 Research Directors.

The Project started in earnest in 1987 with Rubbia’s Long Range Planning Committee recommending the LHC as the right choice for CERN’s future.

Great appreciation of the work of teams that built and now operate the magnificent LHC accelerator.

The CMS experiment is a tribute to the vision of its founders, the dedication of all of its thousands of collaborators in constructing and preparing the experiment in terms of hardware, software, computing, and physics analysis, and now the ones who operate and analyze the data (mostly young scientists!).
March 30 2010: 1st Collisions at 7 TeV
A small fraction of the CMS Collaboration: June 2012
Thanks to all of the CMS institutes

June 2012: 193 Institutions with ~3300 scientists and engineers
~ 2000 Signing Authors (including students)
We congratulate our colleagues in the CERN accelerator departments for the excellent performance of the LHC machine. We thank the technical and administrative staff at CERN and other CMS institutes, and acknowledge support from: BMWF and FWF (Austria); FNRS and FWO (Belgium); CNPq, CAPES, FAPERJ, and FAPESP (Brazil); MES (Bulgaria); CERN; CAS, MoST and NSFC (China); COLCIENCIAS (Colombia); MSES (Croatia); RPF (Cyprus); MoER; SF0690030s09 and ERDF (Estonia); Academy of Finland, MEC, and HIP (Finland); CEA and CNRS/IN2P3 (France); BMBF, DFG, and HGF (Germany); GSRT (Greece); OTKA and NKTH (Hungary); DAE and DST (India); IPM (Iran); SFI (Ireland); INFN (Italy); NRF and WCU (Korea); LAS (Lithuania); CINVESTAV, CONACYT, SEP, and UASLP-FAI (Mexico); MSI (New Zealand); PAEC (Pakistan); MSHE and NSC (Poland); FCT (Portugal); JINR (Armenia, Belarus, Georgia, Ukraine, Uzbekistan); MON, RosAtom, RAS and RFBR (Russia); MSTD (Serbia); SEIDI and CPAN (Spain); Swiss Funding Agencies (Switzerland); NSC (Taipei); TUBITAK and TAEK (Turkey); STFC (United Kingdom); DOE and NSF (USA).

Individuals have received support from the Marie-Curie programme and the European Research Council (European Union); the Leventis Foundation; the A. P. Sloan Foundation; the Alexander von Humboldt Foundation; the Austrian Science Fund (FWF); the Belgian Federal Science Policy Office; the Fonds pour la Formation à la Recherche dans l'Industrie et dans l'Agriculture (FRIA-Belgium); the Agentschap voor Innovatie door Wetenschap en Technologie (IWT-Belgium); the Council of Science and Industrial Research, India; the Compagnia di San Paolo (Torino); Centro Siciliano di Fisica Nucleare e struttura della materia, ‘Teller Fellowship and LDRD’ ,and the HOMING PLUS programme of Foundation for Polish Science, cofinanced from European Union, Regional Development Fund.
The End
Stay tuned
